INTRODUCTION

The shrimp fishery in the Gulf and Atlantic coastal states is considered to be the most valuable fishery in the United States. The Gulf of Mexico has been the major production area for shrimp in the United States, accounting for approximately 80% of the total value of shrimp landed in this country. The directed shrimp fishery in the Gulf of Mexico harvests brown shrimp (Penaeus aztecus), white shrimp (P. setiferus), and pink shrimp (P. duorarum). Of these species, brown shrimp account for approximately 53% of total production, while white and pink shrimp account for 26% and 15%, respectively.

The state of Louisiana is the center of white shrimp production. In 1977, there were over 14 million kilograms (31.3 million pounds) of white shrimp (heads-off weight) landed at commercial businesses in Louisiana (USDOC, 1979).

In 1977, NMFS contracted with the Louisiana Department of Wildlife and Fisheries to tag and release white shrimp in the Caillou Lake estuary system, in response to management priorities identified in the regional shrimp fishery management plan for the Gulf of Mexico (Christmas and Etzold, 1977). These priorities included the determination of estimates regarding growth rates, mortality rates, and migration patterns characterizing major penaeid stocks in the Gulf of Mexico. This report presents a summary of these mark-recapture experiments.

Materials and Methods

Field work for 1977 inshore tagging activities was performed by personnel from Louisiana Department of Wildlife and Fisheries, while offshore work was conducted by NMFS personnel from the Galveston Laboratory aboard a contracted shrimp trawler.

Shrimp were tagged with individually numbered Mini-Ribbon polyethylene streamer tags initially developed at the Galveston Laboratory (Marullo, et al. 1976) and subsequently modified slightly to afford easier insertion through the musculature. The tags are affixed to a slotted-eye needle that is dipped in a 10% antibotic/petroleum jelly mixture prior to insertion between the first and second abdominal segments of the shrimp (Fig. 1). The needle is then detached from the tag and tail length, sex, and species data are obtained and recorded.

A dual approach was taken toward the mark-recapture study by separating it into inshore and offshore segments. Inshore tagging efforts were concentrated in the Caillou Lake estuarine system during July, August, September, and October, while offshore tagging efforts were centered just off the Caillou Lake area in September and west of Caillou Lake in October and December (Fig. 2).

During all inshore studies, shrimp were caught by shrimp trawls towed by outboard skiffs as near as was feasible to the tagging site. Tows were limited to a maximum of five minutes to reduce stress on the shrimp. Shrimp were kept in aerated tanks at least thirty minutes prior to tagging, during which time those in visible distress or dead were culled. After tagging, the marked shrimp were held in aerated tanks or barges for one to twelve hours to alleviate stress due to handling and tagging. Prior to release, dead or moribund shrimp were culled from the holding tank. Releases were at dusk so that those shrimp not leaving the area immediately could burrow to avoid excessive predation.

Figure 1. Detail of Mini-Ribbon polyethylene streamer tag with needle attached, and placement of tag in shrimp.

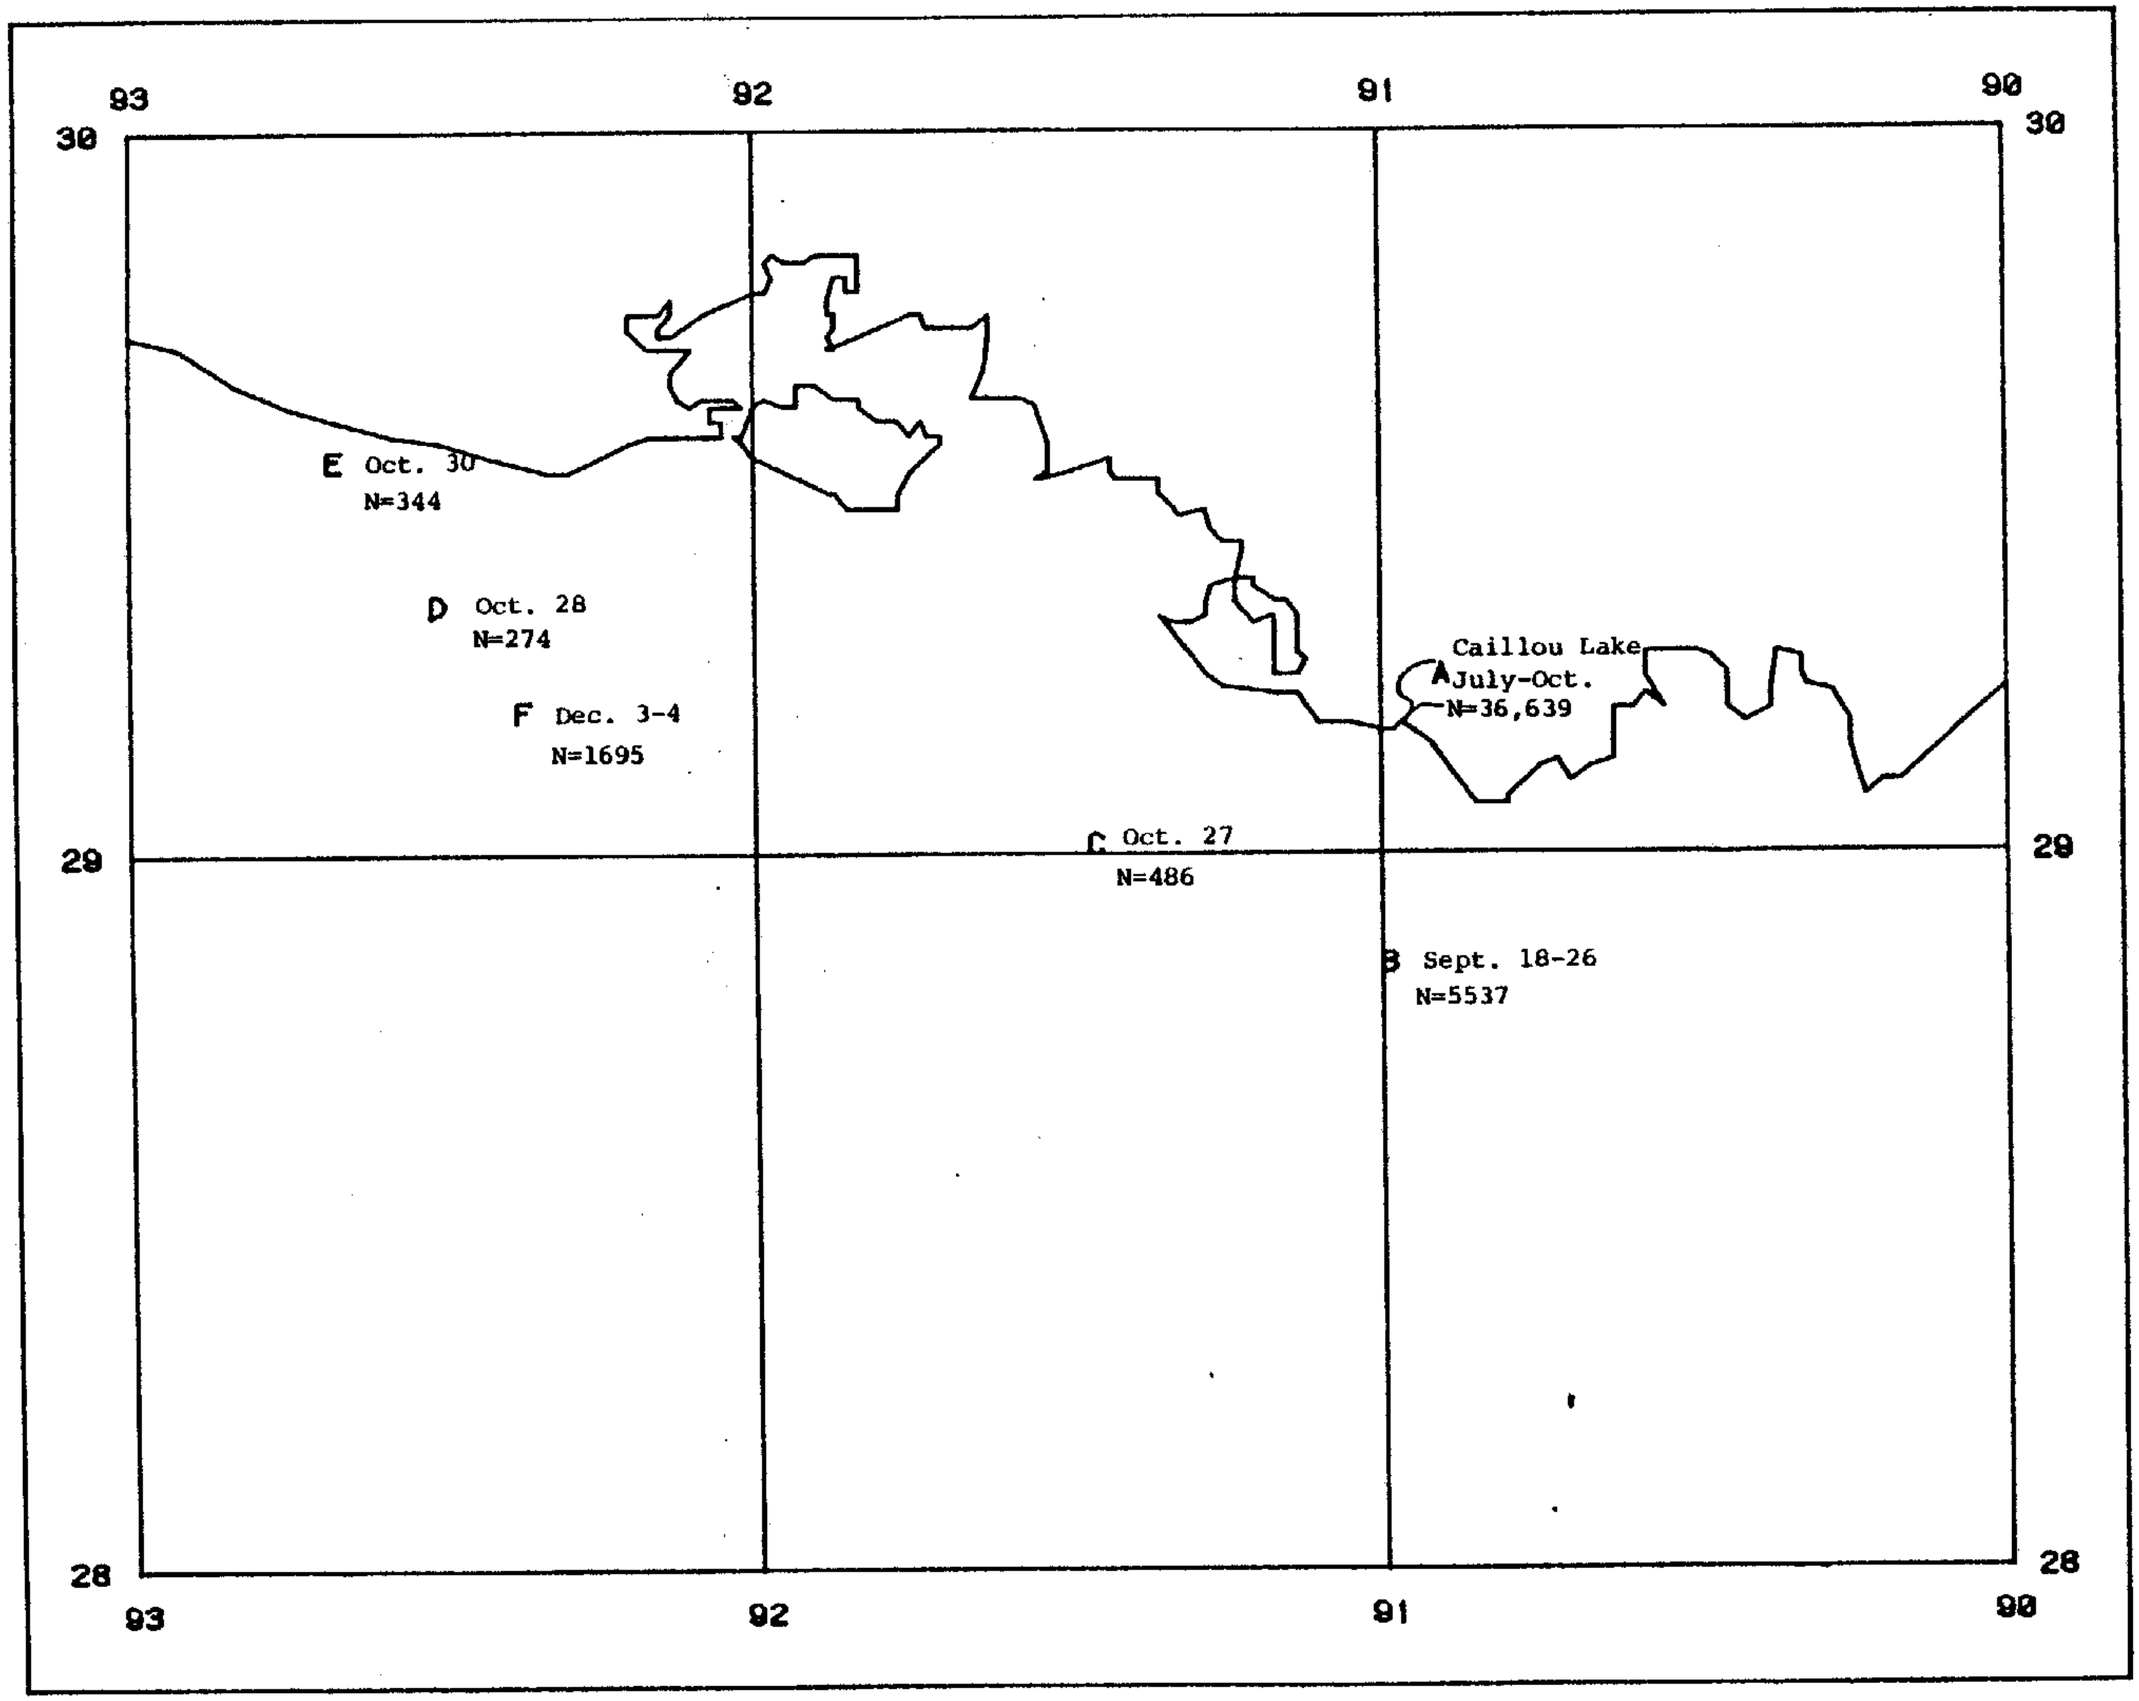

Figure 2. Release sites and number released fo 77 inshore (A) and offshore (B-F) Louisiana white shrimp tagging studies.

Tagged shrimp were released by hand on the surface in or adjacent to grass beds in channel areas in the Caillou Lake area.

Offshore tagging studies were performed using the same marking techniques as were used in inshore efforts. Shrimp were caught by the contracted shrimp trawler, with tows limited to 15 minutes to lessen stress on the shrimp. Shrimp for tagging were maintained in 500 gallon, flow-through tanks fitted with aluminum baffles to reduce the effects of vessel roll. Tagging operations were accomplished while the vessel proceeded to the specified release area. Tagged shrimp were released in weighted cannisters as described by Emiliani (1971) (Fig. 3). Releases of 50 to 100 shrimp per cannister were made each one-quarter to one-half mile.

Incentive Program

To assure the participation of shrimp fishermen recapturing tagged shrimp, a contest award system based on tag numbers was developed. Contracts for publicity and awards presentations were let with the Louisiana State University Center for Wetland Resources, Sea Grant. Under the award system, anyone turning in a recaptured tagged shrimp with all necessary information becomes eligible for cash awards from $50 to $500. Award winners were randomly selected by computer at designated intervals during the year. Posters (Fig. 4) were distributed to fish houses and press releases were published in newspapers throughout the Louisiana coast to advertise the program.

Fishery Statistics

Accurate statistics of U.S. shrimp trawling operations and production in the Gulf of Mexico were not collected prior to 1956. Presently, statistics describing the extensive U.S. commercial shrimp fisheries in the Gulf of Mexico

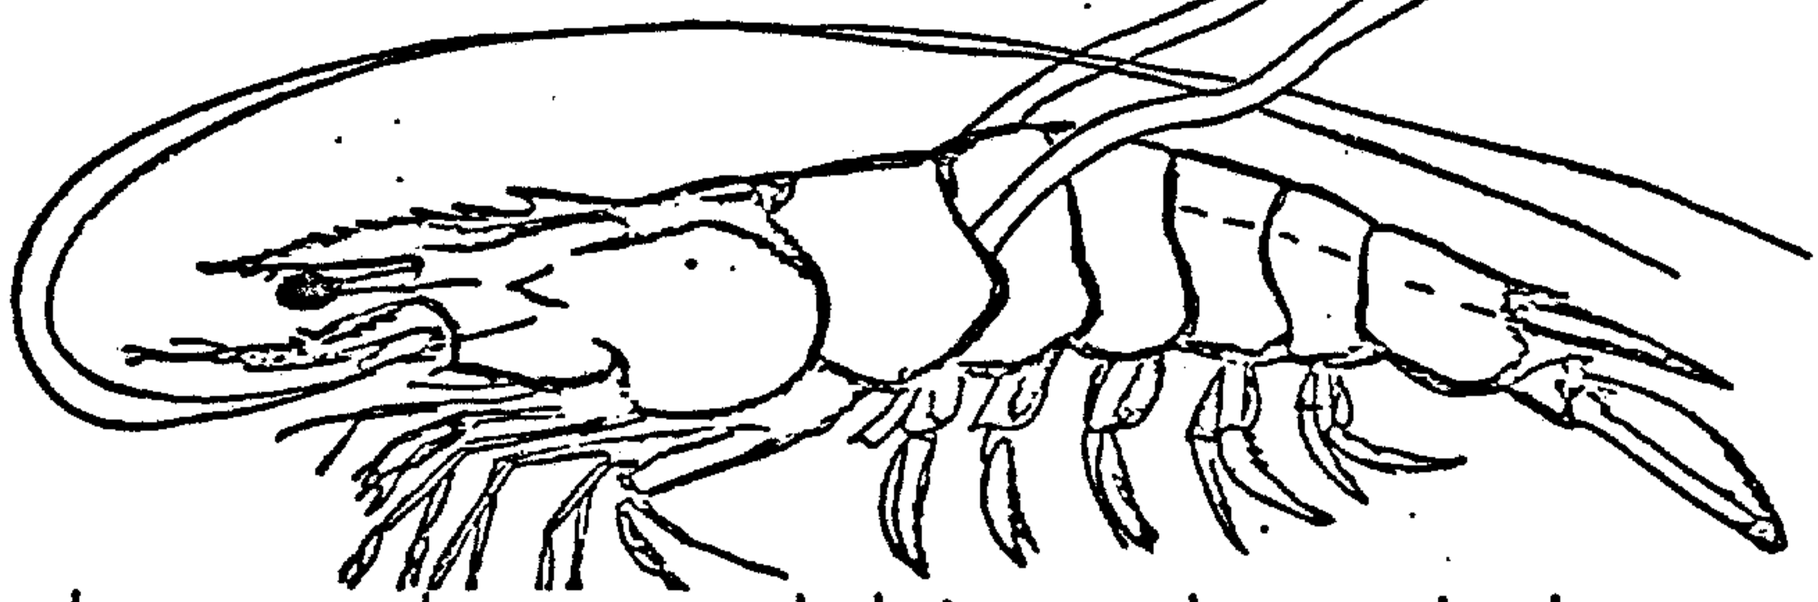
JOIN A FISHING CONTEST

AWARDS!  HELP!

AWARDS FROM $50.00 TO $500.00 !
OUR SHRIMP FISHERY NEEDS YOUR HELP !

SHRIMP HAVE BEEN TAGGED WITH ORANGE PLASTIC RIBBONS LIKE THIS:



If you have caught a tagged shrimp or know who has contact:

AGENCY ADDRESS PHONE NUMBER

Tag identification numbers have already been selected and a priority established. Fishermen returning tags with the highest priority will be given cash rewards. The higher the priority, the higher the reward! The place and time you caught the shrimp must be given. Ten different sets of awards will be made through December, 1978

AWARDS OF $500 --$200 -- $100 -- AND $50
WILL BE AVAILABLE IN EACH SET.

Dates for making awards will be posted.

THIS STUDY IS BEING CARRIED OUT JOINTLY BY THE STATE OF LOUISIANA WILDLIFE AND FISHERIES COMMISSION AND LOUISIANA STATE UNIVERSITY, CONTRACTORS FOR THE NATIONAL MARINE FISHERIES SERVICE.

Figure 4.Poster used in advertisement of Project MEXUS-GULF shrimp tagging program

are routinely collected by the NMFS. A major continuing statistical survey was initiated in 1956 and continues to the present time (Kutkuhn, 1962, Klima, 1980a). Data from these surveys are published monthly in periodicals entitled Gulf Coast Shrimp Data by Area, Depth, Species, and Size, as well as annually in a periodical entitled Gulf Coast Shrimp Data Annual Summaries. These publications include corresponding information on number of fishing trips by commercial trawlers, the total amount of time spent fishing, and the dockside value of total landings. Fishing effort expended by the commercial shrimp fishery in statistical subareas 13, 14, 15, 16, and 17 from July, 1977 to December, 1977 is listed in Table 1.

Table 1. Fishing effort in days fished[1] by the commercial shrimp fishery, statistical subareas 013.0-017.0, offshore to 10 fms. All inshore effort combined.

[1] From 1977 Gulf Coast Shrimp Data

Results and Discussion

Inshore Studies

A total of 36,639 tagged white shrimp were released inshore in the Caillou Lake estuary system between July and October, 1977. Of those released, 3,878 were recaptured, yielding an overall recapture rate of 10.58%. Recapture rates for individual studies were variable, ranging from 5.71% for October releases to 20.54% for August releases (Table 2). Tagged shrimp were caught and returned throughout the estuary system and passes to the Gulf of Mexico. Tagged shrimp at liberty for two months or more had been returned from south of Grand Isle, Louisiana, to East Galveston Bay estuarine system in Texas. Data on individual recaptures, including distance and direction traveled, days at large, and change in length, are presented in Appendix I.

The variability associated with recapture rates from individual studies is related to differing fishing effort and environmental conditions. The July releases were made during a local closed season, allowing approximately two weeks for dispersal prior to the initiation of fishing. Conversely, August releases were made only six days previous to the opening of the season, making these marked shrimp much more vulnerable to the concentrated effort at this time and producing a comparatively high recapture rate of 20.54%. During the October release, cold north winds caused considerable water movement from the estuary, as well as lowering water temperatures. This "norther" could have temporarily decreased fishing effort, and concurrently triggered a mass migration of tagged shrimp to the Gulf. This is evidenced by returns from the October release originating from the offshore fishery at a much earlier time relative to offshore returns from other releases (Lyon and Boudreaux, unpublished manuscript).

Return density by area was determined for all inshore releases combined based on areas six nautical miles square by Lyon and Boudreaux (unpub. ms.).

Table 2. Summary of 1977 inshore Louisiana tagging studies.

MONTH OF RELEASE	NUMBER RELEASED	NUMBER RECAPTURED	PERCENT RECAPTURED
July	9572	659	6.88
August	8705	1788	20.54
September	9448	922	9.76
October	8914	509	5.71
	36639	3878	10.58

Their analysis indicated that 75% of tagged shrimp returns were caught within 12 nautical miles of the inshore release site. Generally, the return data indicate a rapid movement out of the estuarine area. After 30 days of liberty, 28% of tagged recoveries came from the offshore fishery, and after 60 days of liberty, 83% of tagged recoveries originated from the offshore fishery. Of these inshore releases returned from offshore waters, net movement was to the west, with very little eastward movement (Figs. 5,6, and Table 3). This is in agreement with movement patterns determined by Perret and Boudreaux (1976) in an earlier mark-recapture study conducted at Caillou Lake.

Offshore Studies

A total of 8,336 tagged white shrimp were released offshore of Louisiana in September, October, and December, 1977. Of those released, 406 were recaptured, yielding a 4.87% overall recovery rate. Recovery rates for individual studies varied from 3.66% for December releases to 6.16% for October releases (Table 4).

Overall, 72% of recaptures came from within 24 miles of the release area. September releases demonstrated along-shore movement to the west (Fig. 7). Releases were made at two offshore areas in October. Returns from the first October release indicated a westerly movement alongshore, while those from the second release showed movement both east and west (Fig. 8). Recaptured shrimp from the December release indicated a more pronounced eastward movement, in addition to movement into waters deeper than the release location (Fig. 9). Table 5 illustrates the number of days at liberty and the direction traveled of recaptured shrimp from all offshore releases combined.

Manuscripts

Several manuscripts in the form of NOAA Technical Memoranda have been derived from data collected during the 1977 studies. Klima (1980b) reported on the rapid growth rate during July and August, and the slower rates in September and October (Fig. 10). Water temperatures were high in July, decreasing thereafter, showing a good correlation with growth. Phares (1980a) demonstrated that growth of white shrimp is influenced by temperature in that 4-8% of the observed variation in growth in length was explained by temperature. She showed that temperature and age dependent asymptotic growth models account for 81% of the variation between size at release and size at recapture for the 1977 tagging data.

Tail length/tail weight relationships for Louisiana white shrimp were determined by Phares (1980b), and estimates of natural and fishing mortality for white shrimp were estimated by Phares (1980c). The author reported fishing mortality to range from 0.02 to 0.25 and natural mortality from 0.21 to 0.55 per week, these estimates did not utilize fishing effort and therefore assure fishing effert was constant throughout the study (i.e. Fishing effert apparently changed from one time period to the next). A manuscript intended for publication as a Louisiana Wildlife and Fisheries Commission Technical Bulletin dealing with distribution patterns exhitited by white shrimp marked during these studies is being prepared jointly by personnel from NMFS and Louisiana Wildlife and Fisheries Commission Seafood Division.
